

DAYCO'S NEWEST ELASTIC BELT CONSTRUCTION PERFORMS BETTER THAN OE

Maintains Required Tightness Over Longer Periods

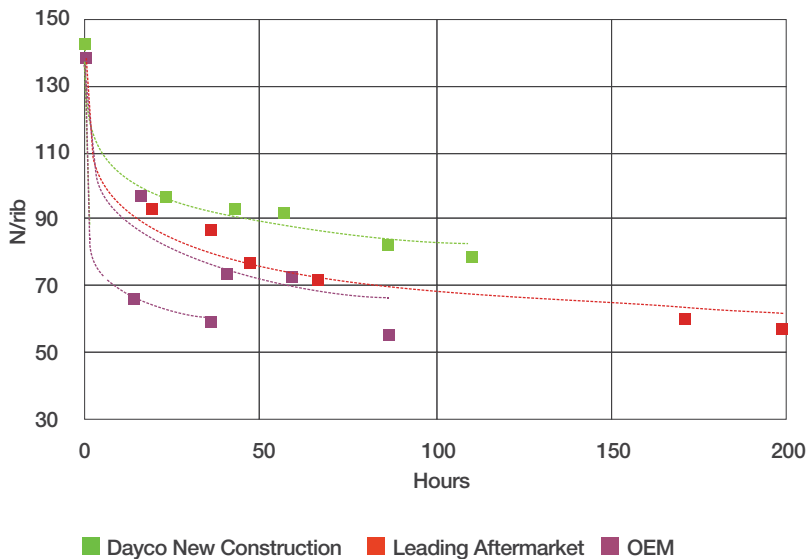

After extensive research and development, Dayco created a new elastic belt construction with an advantage over the OE design. As some of the first stretch belts in the after-market to serve as a main drive belt, Dayco's new ela[®] belt outperformed OEM counterparts and leading competitors in tension decay based on SAE laboratory testing.

As part of Dayco's ela belt line, part no. 6PK1742EE and 6PK1060EE utilize a proprietary high elasticity design to directly maintain proper tension, which in turn, reduces slip, minimizes noise, prevents premature failure and delivers consistent performance.

Tension Decay Test Results

*Testing conducted with part no. 6PK1742EE

Key Features Include:

- **First to drive multiple accessories** – Built for several 2019-2023 GM trucks and 2018-2020 Ford Fusions, these new belts are designed to withstand the rigors of a main drive system, going through extensive engineering to ensure they could power multiple accessories.
- **Extreme durability and stretch** – Wear-resistant EPDM rib material and elastic cushion rubber surround a polyamide tensile cord to maintain proper tension and reliably transmit the exact accessory load demanded for the drive.
- **Superior tension decay performance** — Since ela belts don't use a tensioner, it's imperative that they are designed to maintain tightness over their service life to effectively drive all the accessories. Test results for Dayco belt 6PK1742EE show the belt holds tension more efficiently and for longer periods.
